

# Open House Web Page & Open House Search Features

There are two ways that clients can obtain Open House information from your website.

## 1. Open House System Web Page

The **Open House System Page** provides a results page that displays the open house data that is provided by your MLS board and your EXtranet data. The page is pre-formatted for you and available to drag and drop onto your navigation bar.

## 2. Open house data obtained via custom search definitions

Open house data can be obtained by visitors to your site while performing a search if you have enabled this feature on the search definition. This feature allows you to search the IDX listing data as well as the EXtranet data for Open House results. It also allows you to select other criteria for consumers to choose from. For example: Bedrooms & Bathrooms.

- Go to Web Manager → Set Up → Search Definitions.
- Select the search definition that you will be using on your website.
- You have the option of displaying open house search date fields on the search form or filtering the data pool to only include properties with open house data.
- If you set the **Auto Search, Skip the Search Form** selection to 'Yes', you will only display the results of the search, not search criteria.

Fill in the fields below.
